LIST OF CERTIFIED REFERENCE MATERIALS

Name of CRM	Acronym, № GSO	Number of component	
		Certified	Informed
MAGMATICE ROCK			
Dunite	SDU-1 (GSO 4233-88)	20	6
Trap	ST-2a (GSO 8671-2005)	47	11
Essexitice Gabbro	SGD-2a (GSO 8670-2005)	50	7
Quartz Diorite	SKD-1 (GSO 6103-91)	41	20
Sviatonossite	SSV-1 (GSO 6104-91)	38	21
Alkaline Agpaitic Granite	SG-3 (GSO 3333-85)	47	9
Subalkaline Granite	SG-4 (GSO 10135-2012)	53	7
Synnyrit	SSn-1 (GSO 10171-2012)	36	20
METAMORPHIC ROCKS			
Metamorphic Schist	SSL-1 (GSO 3191-85)	30	9
Limestone Dolomitized	SI-2 (GSO 3193-85)	24	11
Feldspar-bearing Dolomite	SI-3 (GSO 3192-85)	23	9
Black Shale	SCHS-1 (GSO 8549-2004)	51	14
Black Shale (Ore of Suhoi Log)	SLg-1 (GSO 8550-2004)	43	21
Garnet-biotite Plagiogneiss	GBPg-1 (GSO 8871-2007)	51	11
RECENT LOOSE SEDIMENTS			
Baikal Bottom Silt	BIL-1 (GSO 7126-94)	49	17
Baikal Bottom Sediment	BIL-2 (GSO 7176-95)	30	18
Carbonate Background Silt	SGH-1 (GSO 3131-85)	32	8
Terrigenous Background Silt	SGH-3 (GSO 3132-85)	35	6
Anomalous Silt	SGH-5 (GSO 3133-85)	36	5
Carbonate-silicate Loose Sediments	SGHM-1 (GSO 3483-86)	31	9
Alumosilicate Loose Sediments	SGHM-2 (GSO 3484-86)	30	10
Carbonate-silicate Loose Sediments	SGHM-3 (GSO 3485-86)	32	9
Alumosilicate Loose Sediments	SGHM-4 (GSO 3486-86)	34	9
GOLD-BEARING ORES AND ITS FLOAT CONCENTRATE			
Float Concentrate of Gold-bearing Ore	SZK-3 (GSO 2739-83)	5	-
Gold-bearing Ore	SZR-3 (GSO 8815-2006)	5	-
Gold-bearing Ore	SZR-4 (GSO 8816-2006)	5	-
TECHNOGENIC SUBSTANCES			
Coal Ash of KATEK	ZUK-1 (GSO 7125-94)	46	18
Coal Ash of Azey	ZUA-1 (GSO 7177-95)	31	17
Coal Fly Ash	ZUK-2 (GSO 9237-2008)	38	20
Concentrate of Magnetic Cenospheres	KMC-1 (GSO 9234-2008)	37	16
Concentrate of Magnetic Cenospheres	KMC-2 (GSO 9235-2008)	39	20
Concentrate of Magnetic Microspheres	KMM-1 (GSO 9236-2008)	27	26
BIOLOGICAL SUBSTANCES			
Leaf of Birch	LB-1 (GSO 8923-2007)	41	22
Mixture of Meadowherbs	Tr-1 (GSO 8922-2007)	38	25
Canadian Pondweed	EK-1 (GSO 8921-2007)	34	30
Baikal Perch Musculus Tissue	BOk-2 (GSO 9055-2008)	17	9

INTRODCTION

Vinogradov Institute of Geochemistry SB RAS for more than 40 years is developing certified reference materials (CRMs) of natural and man-made environments. In IGC SB RAS fruitful development of science way – Metrology of chemical analysis of substances – connected with the names of well-known spectroscopist-analysts Doctors of Sciences Ya.D. Raikhbaum, S.V. Lontsikh, L.L. Petrov and I.E. Vasil'eva.

Ya.D. Raikhbaum

S.V. Lontsikh

L.L. Petrov

I.E. Vasil'eva

CRM is a fine powder, prepared by grinding solid material of various composition and genesis, in which the mass fractions of major and trace elements and components are certified. The created collection of multi-element samples of natural and man-made environments consists of certified referent materials and referent materials; is regularly replenished by new samples of various composition and genesis; and is focused on ensuring the uniformity of measurements in geoanalysis. CRM collection is used to certify measurement techniques applied in determining the composition of natural and man-made objects; accuracy control (precision and trueness) of the results of chemical, physical and physicochemical methods of laboratory analysis of substances and materials, as well as professional testing of laboratories.

Nomenclature of the collection from Vinogradov Institute of Geochemistry SB RAS is composed of certified reference materials of natural and man-made environments. The natural cluster of the collection is represented by igneous, metamorphic and sedimentary rocks, sediments, biological substances of plant and animal origin. The composition of igneous rocks varies from acidic to ultrabasic. Modern sedimentary rocks are represented by sediments of the Lake Baikal, terrigenous river silt and continental loose sediments. Four samples of the biota include terrestrial and aquatic plants, also Baikal perch tissue. Man-made environments of the collection are presented by gold-bearing ores and products of their processing (concentrates, tails of flotation and gravitation), as well as ash of energy coals of various composition and fractions extracted from it.

The certified values correspond to requirements of the following documents: GOST 8.010-2013, GOST ISO Guide 35:2015, GOST R ISO 5725-2-2002, GOST R ISO 5725-6-2002, RMG 61-2010, OST MPR&E RF 41-08-212-2010, GOST 8.532-2002 and GOST 8.315-97 for the certification of the sample as CRM and RM.

Measurement methods of the determination of certified values and their traceability were used:

- AAS – Atomic-absorption spectrometry;
- AES – Atomic-emission spectrometry;
- AES-ICP – Atomic-emission spectrometry with inductively coupled plasma;
- FAES – Flame atomic emission spectrometry;
- Electrochemical methods such as: AT – Amperometric titration; POL / ISE – Polarography, Ion selective electrode; PT – Potentiometric titration;
- G – Gravimetry;
- MS-ICP – Mass-spectrometry with inductively coupled plasma;
- NAA – Neutron activation analysis;
- SPh – Spectrophotometry;
- T – Titrimetry;

XFS – X-ray fluorescence spectrometry;

TOC – total organic C-H-N-S analysis fulfilled by combustion of the sample in an oxygen atmosphere in quartz tube and using by C-H-N-S analyzers;

and also other methods and techniques with preliminary extraction and sorption of trace elements.

CRMs may be transported by any means of transport provided the air-tightness of package is ensured. After opening the certified reference material should be stored in an airtight container, protected from exposure to chemicals and moisture, at the temperature (20-25) °C and relative humidity less than 80 %.

Some CRMs from the collection were created more than 30 years ago. The contents of elements and components in them are certified according to interlaboratory tests, by analytical methods the most widely used at that time. The development of physical and chemical methods of analysis had been improved accuracy of the results, but the requirements for the metrological characteristics and for the minimum representative mass of CRM have become more stringent (e.g. nowadays analytical methods use analytical weights ≤ 0.1 g). The regular testing of the collection resulted to confirm the homogeneity and stability of the substances of CRMs, and provide the shelflife of these samples up to 40-45 years.

The CRM certified values and their errors (uncertainty) were established by inter-laboratory experiment with participation of qualified laboratories, experienced in the research of substances that are similar in composition and structure to this CRM, in Russia and other countries: Canada, Germany, Great Britain, France, USA, South Africa, Belgium, Netherlands, China, India, Finland, Poland, Mongolia, Hungary, Belarus, Bulgaria, Cuba, Armenia, Georgia, Kazakhstan, Kyrgyzstan, Lithuania, Slovenia, Syria, Tajikistan, Turkey, Uzbekistan and Ukraine.

The CRM collection is a necessary link in the interdisciplinary investigations of fundamental relationships between different natural objects, in carrying out multidisciplinary environmental studies aimed to assess the state and preservation of the environment and human health.

Vinogradov Institute of Geochemistry SB RAS is a scientific organization that develops CRMs in accordance with the requirements Russian Federal Law “Assurance of the Uniformity of Measurements”, Custom Union and the World Trade Organization.

Chronology of creating the collection of multielemental reference materials in IGC SB RAS

Certified Reference Material
Dunite
GSO 4233-88 (SDU-1)

Description. The dunite is sampled in the coastal outcrop of Lake Baikal (Sakhjurti Settlement of the Olkhon region, Irkutsk area). This occurrence of dunites is located within the band of ultrabasitic rocks of the Olkhon region which belong to the Baikal-Muya basitic-ultrabasitic rock belt of the Baikal highland. The ultrabasitic massifs consist of small blocks and lenses of ultramafic rocks occurring in highly metamorphic gneiss-carbonate formations of the Lower Proterozoic age. Rocks are dense, fine-grained, dark-colour with a light greenish hue.

METROLOGICAL CHARACTERISTICS:

Table 1. **Certified values** (for material dried at 105°C) and their **95 % confidence intervals** ($\pm\Delta$)

Component	wt %	$\pm\Delta$	Element	wt %	$\pm\Delta$
SiO ₂	39.58	0.13	Co	0.012	0.001
TiO ₂	0.018	0.002	Cr	0.41	0.01
Al ₂ O ₃	0.97	0.07	Cu	0.0033	0.0004
Fe ₂ O _{3 tot}	8.91	0.07	Ge	0.00011	0.00001
CaO	1.52	0.07	Li	0.00020	0.00003
MgO	41.86	0.28	Ni	0.22	0.01
MnO	0.13	0.01	Sc	0.0009	0.0001
K ₂ O	0.010	0.001	Sr	0.0018	0.0003
Na ₂ O	0.035	0.005	V	0.0033	0.0005
LOI	6.31	0.06	Zn	0.0030	0.0004

Notes:

Fe₂O_{3 tot} – total iron concentration expressed as Fe₂O₃;

LOI – loss on ignition;

wt % – percent of total element/component concentration.

ADDITIONAL INFORMATION:

Table 2. **Information values** (for material dried at 105°C)

Component / Element	wt %	Component / Element	wt %
S _{tot}	0.041	H ₂ O ⁺	4.82
FeO	5.54	CO ₂	1.61
H ₂ O ⁻	0.4	P ₂ O ₅	0.01

Table 3. **Mineral composition**

Mineral / phase	vol. %	Mineral / phase	vol. %
Olivine	60.77	Ore minerals (chrom-spinelle,	
Serpentine	19.14	magnetit)	4.89
Amphibole	7.19	Carbonate	0.81
Orthopyroxene	2.42	Chlorite	2.82
Clinopyroxene	1.77	Talk	0.18

Ore minerals include chrome spinelides and magnetites, the former often replaced by magnetite.

Accessory minerals are single grains of sulphides (pyrrhotite, purite, chalcopyrite), limenite, zircon, rutile and apatite.

Table 4. **Grain size composition** (mass content of fractions in per cent)

Fraction size, μm	+80	-80...+63	-63...+50	-50...+40	-40
Yield of fractions, wt %	0.03	4.92	12.70	13.65	68.70

INSTRUCTION FOR USE: CRM material does not require any additional preparation, except stipulated by the method of analysis. CRM satisfies homogeneity condition by using the minimum representative sample presented in the Table 5. Before use it is recommended to shake the bottle with CRM.

Table 5. Representative samples

Element / Component	Analytical weight, g
Ni, Co, Cu, Cr, V, Al, Ti, Mn, Fe _{tot} , Sc, Ge, Zn, Sr, Li, Na, Ca, Mg	0.1
K, P, Si	0.2
FeO	0.4
LOI	0.5

Date of single batch issue: 20.12.1987.

CRM is issued in conformity with Certificate of certified reference material type approval No. **3038**, valid untitled.

**Certified Reference Material
Trap
GSO 8671-2005 (ST-2A)**

Description. The trap is sampled in a quarry from the bedded body about 100 m thick near the town of Tulun, Irkutsk region, from the middle part of sill and consists of common differentiates of trappian magma, i.e. dolerites with ophitic structure. Macroscopically, these are dense dark-grey rocks.

METROLOGICAL CHARACTERISTICS:

Table 1. Certified values (for materials dried at 105°C) and their 95 % confidence intervals ($\pm\Delta$)

Component	wt %	$\pm\Delta$	Component	wt %	$\pm\Delta$

**Certified Reference Material
Essexitic Gabbro
GSO 8670-2005 (SGD-2A)**

Description. The essexitic gabbro, a coarse-grained rock gabbro texture partially altered by secondary processes, is sampled from the Dalbyrkey massif, which occurs within the Liljunguy-Urovsky volcanic zone of the Akatuy magmatic complex, East Trans-Baikal area.

METROLOGICAL CHARACTERISTICS:

Table 1. Certified values (for materials dried at 105°C) and their **95 % confidence intervals ($\pm\Delta$)**

**Certified Reference Material
Subalkaline Granite
GSO 10135-2012 (SG-4)**

Description. The subalkaline granite is a rock belonging to the granitoids, collected in 1989 in the field of the granite massif Daura-Chentij and Khangai upland (или elevation) (Northern Mongolia, Mongolian People's Republic), characterized by high-potassium, low-calcium composition and appropriate transitional species from subalkaline to alkaline.

Certified Reference Material
Metamorphic Schist
GSO 3191-85 (SSL-1)

Description. The metamorphic schist is sampled from the Upper Proterozoic outcrop of the Timan Ridge, Komi Autonomous Republic. This is quartz-chlorite-sericite schist with thread-like intercalations of coaly-clay composition, fine-bedded, strongly licated. It has a fine-banded, oolitic-like struture and granolepidoblastic texture.

METROLOGICAL CHARACTERISTICS:

**Certified Reference Material
Feldspar-Bearing Dolomite
GSO 3192-85 (SI-3)**

Description. The feldspar-bearing dolomite is sampled from the core material of the Upper Proterozoic metamorphic formations of the Timan ridge Komi Autonomous Republic. Macroscopically, these are pink, grey-pink with a brownish hue marbleized rocks having a homogenous or fine-banded structure and medium-grained texture passing into porphyro- and heterogranoblastic one.

Certified Reference Material
Black Shale
GSO 8549-04 (SCHS-1)

Description. The sample includes carbon-bearing pyrrhotitized black shale of the Khomolkho suite, which is stratigraphically found in Late Proterozoic sedimentary metamorphic sequence. The samples is a composition of 10 separate samples, collected at different sites of the Vysochaishii deposit and the sequence along the Khomolkho river.

**Certified Reference Material
Garnet-biotite Plagiogneiss
GSO 8871-2007 (GBPg-1)**

Description. The garnet-biotite plagiogneiss (GBPg-1) was collected in the Semisosensky Bay area on the western coast of Olkhon island (Lake Baikal, Siberia). This rock forms small schlieren-like inclusions within the granitized country rocks and has a gradual transition into them.

Mineral composition, vol.%: the sample consists mainly of pelitic and fine aleurite mud. The diatom ooze amounts to 16% of the total sample. The fine fraction is largely composed of allotherogenous hydromica, montmorillonite and kaolinite. The coarse fraction of the silt comprises quartz, amphibole, pyroxene, mica, feldspar, chlorite, garnet and the accessory minerals i.e. sphene and zircon. In addition to diatom ooze the authigenous minerals includes hydrogoethite, vernadite, psilomelane, beraunite, hydrotroilite, melnikovite, pyrite and vivianite.

**Certified Reference Material
Baikal Bottom Sediments
GSO 7176-95 (BIL-2)**

Description: Baikal bottom sediments BIL-2 consists in the composition of 13 separate subsamples, lifted from internal Maloye More basin (Lake Baikal's straits). The material corresponds to the recent lacustrine sediments and is characterized by specific sand – aleuro – pelitic poor sorted composition due to the conditions of shallow and small size basin.

Ga	13	CO ₂	7400
Ge	1.3	H ₂ O ⁻	2200
Hf	6.7	SO ₃	500

Mineral composition, vol.%: More than half of mass share of sample makes up the leucocratic minerals-quartz, feldspar, K-feldspar. Essential group (more than 35%) contains melanocratic minerals: monoclinic pyroxenes (more often, diopsides), amphibole (basically, hornblende) and biotite. Ore minerals (about 5%) consist of ilmenite, magnetite and as the accessories – martite-hematite, limonite, leucoxene and pyrite. At the appreciable quantities scapolite, carbonates (basically, calcite), epidote, zoisite, garnet, sphene and apatite are presented. Rutile and zircon are fixed as the accessories. The rare earths phosphates-monazite and xenotime are noted as the individual grains as well as the metamorphogeneous minerals-staurolite, disthen and corundum.

Mineral / phase	vol. %	Mineral / phase	vol. %
Quartz	24.9	Ilmenit	3.4
Plagioklase	20.7	Carbonates	0.9
K-feldspar	8.5	Skapolith	1.0

Gd	4.2				

Mineral composition, vol.%:

The sample consists of three mineral associations. The first contains new formed minerals: calcite, magnesite, gypsum, ettringite, tobermorite, brownmillerite, melilites, wollastonite, monticellite, alite and $\text{Ca}_4\text{Al}_2\text{O}_7\cdot\text{H}_2\text{O}$, $\text{Ca}_3\text{Si}_2\text{O}_7$, $13\text{Al}_2\text{O}_3\cdot6\text{SO}_3\cdot\text{H}_2\text{O}$ compounds. The sample involves the glass phase of variable composition. The sample contains also some non-altered primary minerals: coal particles, quartz, feldspars, pyroxenes, hornblendes, ore minerals and burnt clay.

Mineral composition, vol.%:

The sample consists of three mineral associations: crystalline, glassy and organic materials. The crystalline phases contains both unaltered primary and new formed minerals: K-feldspars, plagioclase (including the anorthite), quartz, garnet, magnetite, hematite, calcite, kaolinite, metakaolinite, wollastonite, mullite and anhydrite. The glass phases consists of variable siderophilic ($\text{Fe}_2\text{O}_3+\text{MnO}+\text{TiO}_2$), high in $\text{SiO}_2+\text{Al}_2\text{O}_3$ and midrange in $\text{CaO}+\text{MgO}$ components. The organic matter contains coke, semicoke and small pieces of unburned coal.

INSTRUCTION FOR USE:

The material does not require additional sample preparation, but provides for the implementation of the conditions of the homogeneity of the impurity distribution when using a representative sample of not less than 0.15 g.

Date of single batch issue: 20.12.2008.

CRM is issued in conformity with Certificate of certified reference material type approval No. 3384, valid till 01.02.2019.

Producers:

- Institute of Geochemistry, Siberian Branch of Russian Academy of Sciences.
- Institute of Chemistry and Chemical Technology, Siberian Branch of Russian Academy of Sciences.

Certified Reference Material
Concentrate of Magnetic Cenospheres
GSO 9235-2008, COOMET CRM 0095-2010-RU (KMC-2)

Description. The sample is made of magnetic cenospheres extracted from the ash obtained by burning coal of the Kuznetsk basin (type B-2 according to GOST 25543-88) at Belovskaya thermal power station. COOMET CRM KMC-2 is admitted to be applied without any limitations in Armenia, Belarus, Bulgaria, Kazakhstan, Kyrgyzstan, Lithuania, Moldova and Ukraine.

**Certified Reference Material
Leaf of Birch (*Betulinus folium*)
GSO 8923-2007, COOMET CRM 0067-2008-RU (LB-1)**

Description. The sample was prepared from autumnal fallen leaves of a birch, which had been gathered in the dry sunny weather in the birch grove on the outskirts of Irkutsk city away from the used roads. COOMET CRM LB-1 is admitted to be applied without any limitations in Armenia, Belarus, Bulgaria, Georgia, Kyrgyzstan, Slovakia and Ukraine.

INSTRUCTION FOR USE: CRM material does not require any additional preparation, except stipulated by the method of analysis. CRM satisfies the condition of homogeneity when using no less than representative weight 1 g. To overcome segregation effect due to storage and transportation, the material should be shaken appropriately before opening the bottle. If there is a need of sample intake below 1 g for an analytical method, it's need to weigh more than 1 g and mix in an agate mortar. Then take necessary weight.

STORAGE AND TRANSPORTATION CONDITIONS: CRM may be transported by any means of transport provided the air-tightness of package is ensured. After opening the certified reference material should be stored in an airtight container, protected from exposure to chemicals and moisture, at the temperature (20-25) °C and relative humidity less than 80 %.

Date of single batch issue: 30.11.2007.

CRM is issued in conformity with Certificate of certified reference material type approval **RU.E.04.999.A № 5228**, valid till 30.11.2027.

Producer:

- Institute of Geochemistry, Siberian Branch of Russian Academy of Sciences.

Certified Reference Material
Mixture of Meadowherbs (Herbae pratenses)
GSO 8922-2007, COOMET CRM 0066-2008-RU (Tr-1)

Description. The mixture of meadowherbs was collected in a natural meadow in the village Khomutovo Irkutsk region in 1995. CRM Tr-1 is admitted to be applied without any limitations in Armenia, Belarus, Bulgaria, Georgia, Kyrgyzstan, Slovakia and Ukraine.

INSTRUCTION FOR USE, STORAGE AND TRANSPORTATION CONDITIONS: CRM material does not require any additional preparation, except stipulated by the method of analysis. CRM satisfies homogeneity condition by using the minimum representative sample 0.5 g, Hg – 0.2 g. Before use it is recommended to shake the bottle with CRM.

CRM BOK-2 should be stored in a freezer before opening bottle.

If you want to select a portion of the material BOK-2, then take the bottle out of the freezer, opened, put into a clean glass (quartz) or glass-carbon cup, weight (more than necessary) and left in air for a few hours (from the evening til the morning next business day), in a fume hood, covered with filter paper to obtain equilibrium with the environment of a substance (temperature and humidity). Close the bottle tightly and return to freezer. When the substance reaches the ambient temperature, select the required analytical weight. These analytical weights are selected for the preparation of solutions for methods AES-ICP, FAES, AAS, MS-ICP, determination of mercury by cold vapor or spectrophotometry. Excessive residue from glass cups discarded as food waste.

CRM may be transported by any means of transport provided the air-tightness of package is ensured.

Date of single batch issue: 01.07.2008.

CRM is issued in conformity with Certificate of certified reference material type approval No. **3018**, valid till 01.07.2018.

Producer:

- Institute of Geochemistry, Siberian Branch of Russian Academy of Sciences.
